A crossed roller slide guide is a precision sliding component that achieves high rigidity and low friction linear motion through cylindrical rollers arranged at 90° intervals between the guide rail and the slider. It is widely used in linear motion mechanisms requiring high positioning accuracy and repeatability. Its typical structure consists of two or more V-shaped or I-shaped guide rails + internally cross-arranged roller retainers + an upper slider/slide table. The rollers roll between mutually perpendicular raceways, simultaneously bearing vertical, horizontal, and a certain overturning moment within a very small space. It features low starting friction, smooth movement, adjustable clearance, and long lifespan, and is widely used in precision measuring platforms, optical equipment, semiconductor clamping mechanisms, and high-precision worktables. In 2025, sales reached 38 million units, with an average price of \$105, a single-line capacity of 4 million units, and a gross profit margin of 32%.
