The global Crosslinking Acrylic Monomer market size is predicted to grow from US\$ 1001 million in 2025 to US\$ 1620 million in 2032; it is expected to grow at a CAGR of 7.2% from 2026 to 2032.

Crosslinking acrylic monomers are multifunctional acrylic or methacrylic compounds (typically di-, tri-, or higher-functional) used to form three-dimensional polymer networks by creating covalent crosslinks between polymer chains during polymerization or curing. Common examples include ethylene glycol dimethacrylate (EGDMA), trimethylolpropane triacrylate (TMPTA), and polyethylene glycol diacrylate (PEGDA), which are widely used in coatings, adhesives, sealants, inks, dental materials, hydrogels, electronics encapsulation, and UV/EB-curable systems to enhance mechanical strength, chemical resistance, thermal stability, and dimensional control. The supply chain begins with upstream petrochemical feedstocks such as propylene, ethylene, acetone, and methanol, which are converted into acrylic acid or methacrylic acid and corresponding alcohols; these intermediates undergo esterification and functionalization to produce multifunctional acrylic monomers, followed by purification, stabilization, and quality control. Midstream producers manufacture and formulate these monomers (often with inhibitors and performance modifiers), while downstream customers—including coating formulators, adhesive producers, polymer compounders, medical material suppliers, and electronics manufacturers—integrate them into polymer systems and finished products tailored to specific curing methods and end-use performance requirements. In 2025, the global crosslinking acrylic monomer market records an annual production volume of approximately 310,000 tons against a global installed production capacity of about 390,000 tons per year, with average unit prices ranging from USD 2,600 to 4,800 per ton, while the industry maintains an average gross margin of around 34%.
