Prices may vary significantly depending on specifications, dimensions, current ratings, and component configurations, while the gross margin of major manufacturers was generally in the range of 30%-50%. Crown Spring is a type of elastic conductive contact component used inside connectors, terminals, or sockets, named after its crown-like, cage-like, or annular spring-finger structure. The product is typically made from elastic metal materials such as copper alloys, beryllium copper, and stainless steel, and is often treated with silver, gold, or nickel plating to improve electrical conductivity, wear resistance, and corrosion resistance. Through multi-point circumferential contact, Crown Spring enables stable electrical connection between pins and sockets, featuring low contact resistance, high current-carrying capacity, low insertion and withdrawal force, vibration resistance, and long service life. Its upstream supply chain mainly includes elastic metal materials such as copper alloys, beryllium copper, and stainless steel; surface treatment materials such as silver, gold, and nickel plating materials; as well as precision stamping, rolling forming, heat treatment, electroplating, and testing equipment. Downstream applications are mainly concentrated in automotive, communications, aerospace, medical, rail transit, and other electrical connection fields, where the product is used in connectors, terminals, sockets, charging interfaces, power modules, and high-current transmission components.

United States market for Crown Spring is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
