A ligament is a band of tissue that holds the bones together, keeping the knee stable. Primarily these ligaments are broadly classified into cruciate ligament and collateral ligament. Further, these are divided into four primary ligaments, namely, Anterior Cruciate Ligament (ACL), Posterior Cruciate Ligament (PCL), Medial Collateral Ligament (MCL), and Lateral Collateral Ligament (LCL). The cruciate ligaments, i.e., the PCL and ACL are crossed ligaments that stabilize the joint while allowing a very large range of motion. Knee injuries are usually the most common musculoskeletal traumas among people, where the Anterior Cruciate Ligament (ACL) injury is one of the utmost frequent occurring knee injuries. Surgical reconstruction is the standard gold treatment for treating knee injuries. Increasing incidences of sports-related injuries have become a leading cause of soft tissue injuries worldwide. Athletes are most likely to injure the ACLs disabling complete stretching of their legs. A type of surgery that involves reconstruction of the ligament is known as ACL reconstruction that lies in the center of one's knee with a graft.
