The global Cryo-Electron Microscope market size is predicted to grow from US\$ 436 million in 2025 to US\$ 615 million in 2031; it is expected to grow at a CAGR of 5.9% from 2025 to 2031.

Cryogenic electron microscopy (cryo-EM) is an electron microscopic technique that involves freezing the biological sample in order to view the sample with the least possible distortion and the fewest possible artifacts.

In cryo-EM, the freezing of the sample is done in ethane slush to produce vitreous, or non-crystalline, ice. The frozen sample grid is then kept at liquid nitrogen temperature in the electron microscope and digital micrographs are collected with a camera.

The advantages of cryo-EM over traditional EM techniques include the preservation of the sample in a near-native hydrated state without the distortions from stains or fixatives needed for traditional EM. With image processing and averaging of multiple images, cryo-EM provides high resolution information.

Global core cryo-electron microscope manufacturers include FootJoy, Nike, Adidas etc. The top 5 companies hold a share about 40%. US and Europe are the largest market, both with share about 38%, followed by Asia Pacific with the share about 22%. In terms of product, 300kV is the largest segment, with a share over 60%. And in terms of application, the largest application is biological science, followed by material science.
