Cryogenic electron microscopy (cryo-EM) is an electron microscopic technique that involves freezing the biological sample in order to view the sample with the least possible distortion and the fewest possible artifacts. In cryo-EM, the freezing of the sample is done in ethane slush to produce vitreous, or non-crystalline, ice. The frozen sample grid is then kept at liquid nitrogen temperature in the electron microscope and digital micrographs are collected with a camera. The advantages of cryo-EM over traditional EM techniques include the preservation of the sample in a near-native hydrated state without the distortions from stains or fixatives needed for traditional EM. With image processing and averaging of multiple images, cryo-EM provides high resolution information.

The global Cryo-Electron Microscopy market size is projected to grow from US\$ 329 million in 2024 to US\$ 658 million in 2030; it is expected to grow at a CAGR of 12.2% from 2024 to 2030.
