## Abstracts

The global Cryogenic Hydrogen Compressors market size is predicted to grow from US\$ 698 million in 2025 to US\$ 1277 million in 2031; it is expected to grow at a CAGR of 10.6% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Cryogenic hydrogen compressors are specialized mechanical devices designed to compress hydrogen gas at extremely low temperatures, typically below  $-150^{\circ}\text{C}$  ( $-238^{\circ}\text{F}$ ), to facilitate its storage, transport, or liquefaction. These compressors operate under cryogenic conditions to manage hydrogen in its liquefied or supercooled gaseous state, ensuring minimal energy loss, enhanced density, and safer handling during high-pressure operations. They are crucial in hydrogen liquefaction plants, fueling stations for liquid hydrogen (LH<sub>2</sub>), aerospace propulsion systems, and other hydrogen-based energy infrastructures. Unlike ambient-temperature compressors, cryogenic hydrogen compressors must be built with materials and sealing technologies that resist embrittlement, thermal contraction, and hydrogen leakage at ultra-low temperatures. Common technologies include piston compressors, diaphragm compressors, and turbo compressors specifically adapted for cryogenic hydrogen service.

Cryogenic hydrogen compressors operate under ultra-low temperatures (often down to  $-253^{\circ}\text{C}$ ) and are designed to handle hydrogen in its liquid or cryo-gas state, with key parameters varying by compressor type. Diaphragm compressors typically achieve outlet pressures up to 1,000 bar with flow rates of 1–1,000 Nm<sup>3</sup>/h and ultra-low leakage ( $<10^{-6}$  mbar·l/s), using materials like stainless steel and PTFE. Reciprocating (piston)

compressors handle 100–900 bar with flow rates of 10–5,000 Nm<sup>3</sup>/h across 2–5 stages, with cryogenic seals and dry or oil-free lubrication. Centrifugal (turbo) compressors are used in high-capacity systems, delivering 30–60 bar at flow rates up to 50,000 Nm<sup>3</sup>/h, often in liquefaction plants. Ionic compressors offer silent, oil-free performance with similar pressure ranges and flow up to 500 Nm<sup>3</sup>/h. LH<sub>2</sub> booster pumps operate at  $\approx 253^{\circ}\text{C}$ , compressing liquid hydrogen from 1–3 bar up to 100 bar, typically at flow rates of 5–100 kg/h, using cryo-compatible alloys and polymers.
