Cryovials are tubes made from autoclavable polypropylene material. All polyethylene, including polypropylene, are characterized as polyolefin, a compact-molecular hydrocarbon. Its chemical makeup is the same as polyethylene; however, every unit contains a methyl group attached to it. Its chemical composition enables it to be non-contaminating, lighter than H₂O, and non-toxic.

The abovementioned traits are why polyethylene is the best material for making cryovials. Cryovials are designed to store biological material at shallow temperatures of about -196 °C, which Liquid Nitrogen achieves in gas form.
