The global Cryogenic Transportation Service market size is predicted to grow from US\$ 737 million in 2025 to US\$ 1142 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

Cryogenic Transportation Service refers to a logistics service that uses professional temperature control equipment and technology to maintain a specific low-temperature environment throughout the transportation process to ensure the quality, safety, and effectiveness of temperature-sensitive goods. Its core lies in using refrigerated trucks, refrigerated containers, and other equipment in conjunction with continuous temperature monitoring to achieve uninterrupted cold chain refrigeration of goods during warehousing, transportation, and transshipment. It primarily serves goods requiring constant low temperatures, such as pharmaceuticals (e.g., vaccines, biological agents), fresh food, and fine chemicals. It is a crucial link in ensuring product activity and preventing spoilage, and has strict requirements for equipment reliability, process control, and timeliness.

The costs of Cryogenic Transportation Service primarily consist of high fixed assets (temperature-controlled vehicles/equipment), fuel and electricity, intensive operation and maintenance, and end-to-end monitoring, resulting in a high proportion of fixed costs. Due to its technical expertise, high qualification thresholds, and inelastic demand (especially in the pharmaceutical cold chain), it has strong pricing power. The industry average gross profit margin is typically between 15% and 25%, but it is significantly affected by route occupancy rates, seasonal fluctuations, and compliance costs.

The global development of cryogenic transportation service exhibits significant regional imbalances. North America and Europe are the most mature markets, with stringent

regulatory systems (such as EU GDP and US FDA standards), advanced technology, and high concentration, having entered a phase of refined management and green, low-carbon transformation. The Asia-Pacific region is the fastest-growing engine, especially China, which has experienced rapid expansion driven by e-commerce, but its infrastructure and standards are still under development; Japan leads the world in cold chain efficiency. Other emerging markets, such as Southeast Asia, Latin America, and the Middle East, have significant demand growth potential but face challenges such as insufficient infrastructure and fragmented networks. Currently, they are mainly focused on primary food cold chain logistics, while high-value cold chain logistics for pharmaceuticals is gradually developing. The global market is accelerating technological integration and standards mutual recognition.
