A cryosurgical unit is a device that employs extreme cold or freezing temperature in surgery to treat diseased or abnormal tissue by involving surgical application of cryoablation technique. They are available as consoles or as stand-alone or handheld units. Cryosurgery has been historically used to treat a number of diseases and disorders, especially a variety of benign and malignant skin conditions. The main advantage of cryosurgery is that cell destruction is localized, which minimizes damage to surrounding healthy tissue. Two main methods are used to cool the cryoprobe. It is either based on the expansion of a compressed gas through a nozzle, causing cooling by the Joule-Thomson effect, or the use of cryogenic liquids such as liquid nitrogen. Cryosurgery is an accepted treatment modality within the fields of dermatology, oral surgery, gynaecology, urology, otolaryngology, proctology, and ophthalmology.
