Abstracts

The global Cryotherapy Spray market size is predicted to grow from US\$ 438 million in 2025 to US\$ 702 million in 2032; it is expected to grow at a CAGR of 7.0% from 2026 to 2032.

Cryotherapy spray is a physical treatment method that utilizes liquid nitrogen (or another cryogenic medium) to directly spray lesional skin via a specialized applicator. It causes the pathological tissue to freeze instantly, leading to cellular necrosis and thrombosis; the tissue subsequently sloughs off, thereby achieving the therapeutic objective. This method is primarily used to treat benign growths?such as warts, corns, and seborrheic keratoses (age spots)?or superficial skin cancers, and is characterized by minimal trauma and rapid recovery.

In 2025, the global production volume of cryotherapy sprays is projected to reach 23.7 million units, with an average price of \$18.9 per unit and an average gross margin of 43.8%.

From a supply perspective, the market consists of three main groups. The first group includes professional cryosurgery-device specialists such as Brymill, Cortex, H&O Equipments, CryoIQ, Cryoswiss and CryoSurgery Inc., whose products are sold mainly to dermatology, podiatry, general practice, gynecology/urology, veterinary and aesthetic clinics. The second group includes portable aerosol cryosurgical-system suppliers such as CryoConcepts and Gebauer, whose products are built around packaged cryogen canisters, applicators, cones or disposable devices. The third group includes OTC wart-freezing and self-care brands such as Compound W, Dr. Scholl's, Wartner, Royal Uterm?hlen/HeltiQ and Oystershell-backed products, which are sold through pharmacies, e-commerce and retail channels. Oystershell's own materials describe a model of developing product innovations, licensing intellectual property and supplying finished products to healthcare partners, which helps explain why OTC cryotherapy

sprays often involve both brand owners and specialized product developers.

Demand growth is supported by primary-care dermatology, podiatry clinics, general practitioners, aesthetic clinics and home-use wart removal. Professional users value freezing temperature, spray precision, number of treatments per canister, indication range and controlled application. Home users value safety, simplicity, price, skin protection and convenience for common and plantar warts. Clinical evidence on wart cryotherapy devices indicates that nitrous oxide-based home-use devices can be safe and user-friendly, which supports the product direction toward easier-to-use and more standardized self-care cryotherapy devices. However, the category remains sensitive to indication boundaries, user error and the risk of burns or scarring when cold energy is applied incorrectly.

From a technology perspective, the industry is moving from simple freezing toward more precise, safer and more standardized delivery. Liquid nitrogen offers very low temperature and broad professional-use flexibility, but it requires cryogen supply, storage and trained users. DME/propane aerosol products are cost-effective, shelf-ready and well suited to OTC wart treatment, but offer less depth and temperature control. Nitrous oxide microjet systems improve portability and precision without liquid nitrogen storage, and can be supplied as reusable devices with cartridges or disposable pen-like systems. CryoConcepts CryOmega uses liquid nitrous oxide direct spray at -89°, CryoIQ offers liquid spray freezing models such as PRO Liquid, and Cryoalfa positions its mobile devices for warts, skin tags, fibromas, keratoses and other common skin lesions.
