Abstracts

The global Crystalline Silicon Square Wire market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

For square crystalline silicon ingots, after the silicon ingot is cut, it must be cut into squares, that is, the silicon ingot is cut into rectangular silicon blocks of a certain size along the longitudinal direction of the crystal growth of the silicon ingot.

The cutting speed of crystalline silicon squaring wire is 2-3 times that of mortar cutting. The cutting surface quality and cutting accuracy are good, and it can also save energy and reduce consumption. Diamond wire is mainly used for cutting hard and brittle materials such as crystalline silicon, sapphire, and magnetic materials. Diamond wire for photovoltaic crystalline silicon slicing accounts for more than 90% of the total demand. Diamond wire is made by uniformly consolidating diamond powder particles on a high-strength steel wire matrix with a certain distribution density through a certain method. Through the diamond wire cutting machine, the diamond wire can form a relative grinding motion with the object to achieve the purpose of cutting. At present, diamond wire is mainly used for cutting hard and brittle materials such as crystalline silicon, sapphire and magnetic materials. From the perspective of the diamond wire industry chain, the upstream is mainly diamond powder, steel wire and nickel; the midstream of the industrial chain is diamond wire production and manufacturing; the downstream diamond wire is mainly used for cutting hard and brittle materials such as crystalline silicon, sapphire, and precision ceramics.
