The global Cu-Diamond and Al-Diamond market size is predicted to grow from US\$ 217 million in 2025 to US\$ 512 million in 2032; it is expected to grow at a CAGR of 13.3% from 2026 to 2032.

Copper diamond is a composite material of diamond powder and copper alloy. High quality artificially synthesized diamond powder is used, which has a thermal conductivity of around 600W/M.K and an extremely low coefficient of thermal expansion. Under appropriate processes, diamond particles can form metallurgical bonding interfaces with copper alloys, resulting in copper diamond composite materials with excellent thermal conductivity and suitable coefficient of thermal expansion. Aluminum diamond is a composite material composed of aluminum and diamond, which is an excellent material with low thermal expansion, high thermal conductivity, high strength, and lightweight. This product has received high attention as a heat dissipation component for GaN semiconductor chips.

The existing electronic packaging materials, such as W-Cu, Mo Cu, SiCp Al, SiCp Cu, and BeO Cu composite materials, are unable to meet the heat dissipation requirements of future high-power devices. It exhibits limitations in the application of high output modules. Diamond copper is a typical composite material in the industry that pursues higher thermal conductivity. In recent years, the semiconductor industry has developed rapidly, and the requirements for material weight and thermal conductivity of semiconductor materials have become increasingly high. Overall, the demand for metal diamond composite materials in the market has increased significantly in recent years.
