A current output temperature sensor is a sensor that converts temperature into a current signal output. By measuring temperature and converting it into a corresponding current signal, it converts temperature information into a standard electrical signal that can be read and processed by measurement and control systems. This type of temperature sensor usually uses sensing elements such as thermistors or thermocouples to detect temperature changes and convert them into current signal outputs. Specifically, when the temperature changes, the resistance value or voltage value of the sensing element will change accordingly, and this change is converted into a corresponding current signal output through the current regulator or current output device in the circuit.
