Current detection chip resistor, also known as current detection resistor, is an electronic component used to detect current flow in electronic circuits. These resistors are designed to have very low resistance values, usually in the range of milliohms to a few ohms. This low resistance value allows them to be connected in series with the load or power supply, where they can detect the current flowing through the circuit. Current

detection chip resistors are usually made of metal alloys with low resistance temperature coefficient, which means that their resistance values remain relatively stable in a wide temperature range. They are also designed to have high power ratings, allowing them to withstand high levels of current without overheating.
