The global Current Transformer Core market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The core of a current transformer is the core component used to measure current and convert it into a measurable signal. It usually consists of an iron core and a winding. The iron core is the main part of the current transformer, which plays a role in concentrating the magnetic field and guiding the current. Iron cores are usually made of silicon steel sheets or nickel iron alloys, which have high magnetic conductivity and low hysteresis losses. The shape of the iron core can be circular, rectangular, or other shapes, depending on the design and application of the transformer. A winding is a wire wound around an iron core, used to induce current and convert it into a measurable signal. The winding is usually composed of multiple layers of insulated wires to improve insulation performance and reduce current loss. The design and layout of windings can also affect the performance and accuracy of current transformers. Current transformers are widely used in fields such as power systems, industrial automation, and energy metering to measure and protect current in circuits.

United States market for Current Transformer Core is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
