The global Current Transformer Delay Loop market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The current transformer delay loop is an optical fiber ring used for all-fiber current transformers, which can realize optical conversion and delay of current signals. The principle of the current transformer delay loop is to use the Faraday effect of the polarization-maintaining optical fiber to convert the current signal into an optical signal, and then adjust the delay of the optical signal through the length of the optical fiber ring, thereby realizing the detection of the current signal. The advantages of current transformer delay loops are high reliability, low cost, excellent temperature performance, stable and reliable supply of raw materials, and fast and stable batch delivery. The application scenarios of current transformer delay loop are power systems, grid monitoring, power quality analysis, etc.
