The global Curtain Coating Machines market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Curtain coating machines are principally used to coat flat components in the door, kitchen or interior fittings industries and to coat parquet flooring.

Curtain coating machines are machines that use the curtain coating method to apply a thin and uniform layer of fluid on a substrate or object. Curtain coating is a technology where the coating fluid is formed into a continuous curtain that falls onto the substrate or object. The substrate or object is transported on a conveyor belt or calender rolls at a regulated speed through the curtain to ensure an even coat of the fluid. The curtain is created by using a slit or die at the base of the holding tank, allowing the liquid to fall upon the substrate or object. Some polymers are melted and extruded for coating. Many manufacturers also include a catch pan to retrieve and reuse the excess fluid. The industry trend of curtain coating machines is positive and growing, as more customers and industries require accurate and reliable application of functional fluids on various substrates or objects. Curtain coating machines can offer several advantages, such as faster coating velocity, ability to produce thinner coats, lower cost of dies, lower waste of coating, and better coverage of abstract surfaces. Curtain coating machines can also enable one or more fluid layers to be applied in a single operation, depending on the design of the die. The main drivers of this growth are the increasing demand for curtain coating machines in various sectors, such as papermaking, printing, packaging, electronics, energy, and automotive.
