The global Curved Screen Display market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

A curved screen monitor uses a 90-degree vertical line in the middle of the screen as its axis, and the left and right screens are brought together toward the middle, thus presenting a curved screen effect. It is a display screen made of flexible plastic, mainly realized through OLED panels. Compared with direct-facing screens, curved screens have better elasticity and are less likely to break. Curvature is a measure of curved monitors and refers to the degree of curvature of the screen, measured in R.

As flexible OLED technology continues to mature, curved screens are no longer just a single look and feel optimization, but can also achieve various forms such as folding and curling, becoming an important part of the design of various electronic products. This variety of curved screen products will provide users with more personalized and experiential digital product solutions.
