The global Custom Support Insoles market size is predicted to grow from US\$ 1471 million in 2025 to US\$ 2899 million in 2032; it is expected to grow at a CAGR of 10.4% from 2026 to 2032.

Custom support insoles are in-shoe support devices designed and manufactured individually based on a user's foot shape, gait pattern, and specific needs. They primarily optimize the biomechanical alignment of the lower limbs by precisely conforming to the arch curve, evenly distributing foot pressure, and providing necessary support to the ankle joint. Unlike standardized insoles, custom support insoles aim to alleviate pain and discomfort caused by prolonged standing, exercise fatigue, or minor foot problems such as collapsed arches, improve shoe fit and comfort, and to some extent, assist in improving gait and posture. In 2024, sales volume was 5.85 million units, with an average price of US\$235, a single-line production capacity of 200,000 units, and a gross profit margin of 68%.

The custom support insole market is benefiting from the continued global focus on health, sports, and ergonomic products. With longer working hours, prolonged standing, or increased physical activity, the demand for foot comfort and fatigue relief is surging. Custom support insoles, as an effective preventative and non-medical intervention, can significantly improve foot fatigue and minor discomfort in the general population. Furthermore, companies providing occupational health benefits to their employees are also driving the penetration rate of custom support insoles among people who stand for long periods in factories, retail, and other industries, ensuring the robust growth of this market.

The current market competition focuses on achieving low-cost, large-scale personalized

customization. Traditional handmade customization is costly, limiting its widespread adoption. Therefore, manufacturers are heavily investing in portable 3D scanning equipment, AI-assisted design software, and flexible manufacturing technologies such as 3D printing. These technologies enable retailers and sporting goods stores to quickly collect user data and complete insole design and manufacturing in a short time, significantly reducing the marginal cost and delivery time of customization, thus expanding customization services from the high-end medical field to a broader retail and sports consumer market.
