The global Custom Transformer market size is predicted to grow from US\$ 7396 million in 2025 to US\$ 11495 million in 2032; it is expected to grow at a CAGR of 6.6% from 2026 to 2032.

Custom transformers are transformers specifically designed and manufactured to meet unique electrical, mechanical, thermal, and dimensional requirements that cannot be fulfilled by standard off-the-shelf transformer products. They are widely used in power supplies, industrial equipment, renewable energy systems, electric vehicles, telecommunications infrastructure, medical devices, and specialized electronic systems. Custom transformers can include power transformers, isolation transformers, high-frequency transformers, toroidal transformers, planar transformers, and application-specific magnetic components tailored to voltage levels, current ratings, frequency, efficiency, insulation class, size constraints, and environmental conditions. From a value chain perspective, upstream includes magnetic core materials (such as ferrite, silicon steel, amorphous alloys), copper or aluminum windings, insulation materials, bobbins, varnishes, and electronic components; midstream involves electromagnetic design, simulation, prototyping, winding, assembly, impregnation, testing, and customization engineering; downstream demand comes from OEMs and ODMs in consumer electronics, industrial automation, automotive electronics, energy systems, telecom equipment, and medical technology. In 2025, the average selling price is approximately US\$105 per unit, global shipments are about 72 million units, and industry gross margin generally ranges from 15% to 28%, supported by engineering customization capability, low-volume high-mix production, and application-specific performance requirements.

The custom transformer market is moving toward higher specialization, faster development cycles, and closer integration with end-application requirements. Compared with standard transformer products, custom transformers are increasingly valued for their ability to meet specific size, thermal, insulation, efficiency, and

electromagnetic compatibility requirements in compact and performance-sensitive systems.

One major trend is the rising demand from high-frequency and high-efficiency power conversion applications. As power electronics continue shifting toward smaller size, higher switching frequencies, and better energy efficiency, demand is increasing for custom magnetic components designed for chargers, industrial power supplies, telecom systems, renewable energy converters, and electric vehicle electronics.

Another important direction is miniaturization and high power density. Customers increasingly require transformers that can fit into more compact assemblies while maintaining low loss, stable temperature rise, and long service life. This is driving greater use of optimized winding structures, improved core materials, planar designs, and thermal management-oriented engineering.

Supply flexibility is also becoming a key competitive factor. Many downstream OEM and ODM customers need low-volume, multi-specification, and fast-turnaround transformer solutions, especially in industrial, medical, and specialized electronics applications. As a result, engineering support, rapid prototyping, and application co-development are becoming more important than simple mass production capability alone.
