The diamond window is a method that combines the excellent optical properties of diamond with other excellent mechanical, thermal, electrical and chemical properties through microwave plasma chemical vapor deposition process, hot wire chemical vapor deposition process, DC arc plasma spray chemical A class of diamond optical elements with different geometries that can be used under extreme conditions, prepared by synthetic methods such as vapor deposition processes. The applicable wavelengths of the current diamond windows basically cover all wavelengths from X-rays, deep ultraviolet to microwaves. The larger the window size is, the more it can meet the application of high power, high resolution and high precision in satellite detection, laser weapons, missile guidance and other fields. This article counts the CVD process diamond window, Chemical Vapor Deposition chemical vapor deposition, refers to the chemical vapor deposition method of growing diamond. The mixture of carbon-containing gas and hydrogen is excited and decomposed at high temperature and pressure lower than standard atmospheric pressure to form active diamond carbon atoms, which are deposited and grown on the matrix to form diamond.
