A continuously tunable laser is a laser that can continuously adjust the output wavelength within a certain range. Traditional fixed-wavelength lasers output a specific wavelength, which cannot be adjusted in real time. The continuously tunable laser can achieve continuous adjustment of the output laser wavelength by changing its internal structure or control parameters. Continuously tunable lasers typically employ a technique called external cavity feedback. This technique uses optical elements, such as gratings or optical cavities, to reflect some of the laser light back inside the laser, creating an optical feedback loop. By adjusting these optical components or parameters inside the laser, the output wavelength of the laser can be changed. Continuously

tunable lasers find widespread use in many application areas, including optical communications, spectroscopy, optical microscopy, biomedical imaging, and more. Because it can adjust the output wavelength in real time, it can be used for experiments or applications in different wavelength ranges, and has high flexibility and adaptability.
