The global Cyanide-free Gold Plating Solution market size is predicted to grow from US\$ 360 million in 2025 to US\$ 832 million in 2032; it is expected to grow at a CAGR of 13.0% from 2026 to 2032.

Cyanide-free Gold Plating is a metal gold plating process that does not use cyanide (sodium cyanide or potassium cyanide) as the electrolyte for gold plating. Traditional gold plating processes usually use electrolytes containing cyanide to complete gold deposition, because cyanide can effectively dissolve gold and provide a stable electroplating process. However, cyanide is highly toxic and poses risks to the environment and the health of operators. Cyanide-free gold plating uses a chemical formula that replaces cyanide, usually using organic compounds or other metal salts that do not contain cyanide to ensure the quality of the metal plating while reducing environmental pollution and operating hazards. This type of technology is widely used in electronics, jewelry, semiconductors and other high-end manufacturing industries, especially in situations where environmental friendliness is required, and has gradually replaced the traditional cyanide gold plating process.

Cyanide-free gold plating is increasingly driven by tightening environmental regulations, such as REACH in Europe and OSHA standards in the U.S., which restrict the use of hazardous chemicals like cyanide. As industries face growing pressure to reduce toxic emissions and improve workplace safety, manufacturers in electronics, jewelry, medical devices, and precision engineering are actively seeking safer alternatives. At the same time, consumer demand for sustainable and ethically produced goods, especially in high-end markets, further compels brands to shift toward cyanide-free solutions.

Technological advancements in gold-sulfite and thiosulfate-based plating chemistries now enable comparable plating quality, making the transition both environmentally and

economically viable.
