A cyberspace asset mapping platform is a cybersecurity solution used to automatically discover, identify, and visualize digital assets on the internet or corporate networks. This platform builds a comprehensive asset inventory by scanning networks, domain names, IP address ranges, cloud environments, and web applications, including servers, databases, IoT devices, API interfaces, and various software services. By continuously monitoring these assets, organizations can promptly identify potential vulnerabilities, misconfigurations, and unauthorized system exposures, thereby reducing the risk of cyberattacks. Cyberspace asset mapping platforms are widely used in information security management by government cybersecurity agencies, financial institutions, telecommunications operators, internet companies, and large enterprises to improve attack surface management and network defense capabilities. The upstream of the cyberspace asset mapping platform industry chain includes providers of scanning engines, threat intelligence databases, vulnerability detection technologies, cloud computing infrastructure, and big data processing technologies; the midstream consists of cybersecurity vendors responsible for developing asset discovery platforms, visualization tools, and security management systems; downstream applications mainly include government cybersecurity agencies, financial institutions, internet companies, telecommunications operators, and enterprises and organizations requiring continuous monitoring of network assets and attack surfaces. In addition, the industry chain also includes security consulting, system integration, continuous monitoring services, and cybersecurity risk assessment services. The gross profit margin of major vendors in the industry is generally between 55% and 70%.
