The global Cyclic Olefin Copolymer Film market size is predicted to grow from US\$ 2046 million in 2025 to US\$ 3785 million in 2032; it is expected to grow at a CAGR of 9.2% from 2026 to 2032.

Cyclic Olefin Copolymer Film is a high-performance thermoplastic film made by copolymerizing cyclic olefin monomers (such as norbornene) with linear olefins (like ethylene), typically using metallocene or Ziegler-Natta catalysts. It is known for its exceptional optical clarity, low moisture absorption, high chemical resistance, excellent electrical insulation, and stable dimensional properties, making it ideal for advanced applications. The supply chain starts upstream with petrochemical feedstocks (ethylene from naphtha or ethane cracking and cyclic olefin intermediates derived from dicyclopentadiene or norbornene chemistry), followed by polymerization carried out by major chemical producers such as TOPAS Advanced Polymers, Zeon Corporation, and Mitsui Chemicals, which manufacture COC resin. Midstream, specialized film converters process the resin into films using extrusion or biaxial orientation (BOC) technologies to enhance barrier and mechanical properties. Downstream, COC films are supplied to industries such as medical and pharmaceutical packaging (blister packs, diagnostic chips), electronics (optical films, display substrates), and food packaging (high-barrier transparent films), where performance consistency and purity are critical. In 2025, global Cyclic Olefin Copolymer Film output was about 220,000 tons with 340,000 tons of capacity, average prices of USD 8,000-18,000 per ton, and gross margins around 38%.
