Cyclized rubber negative photoresist is a negative photoresist that uses cyclized rubber as a base material. During the exposure process, the cyclized rubber in the photoresist reacts with the photosensitizer to form a cross-linked network structure, making the photoresist in the exposed area insoluble in the developer. The unexposed area will be dissolved by the developer, leaving a fine pattern on the substrate.

The global Cyclized Rubber Negative Photoresist market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
