Cyclone classification is a physical separation technology based on particle size, density and fluid dynamics. It is widely used in the classification, concentration and dehydration of particles in solid-liquid or solid-gas mixtures. Its core equipment is the cyclone, which uses the centrifugal force generated by the high-speed rotating flow field to make particles of different sizes or densities move along different paths, thereby achieving separation. Small or low-density particles are discharged with the upper overflow, while coarse or high-density particles settle with the bottom flow. Cyclone classification has the advantages of compact structure, large processing capacity, no moving parts, and stable operation. It is an indispensable classification method in mineral processing, coal washing, chemical industry, building materials and other industries.

United States market for Cyclone Classification is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Cyclone Classification is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
