Cyclone Dip Tube is a device used in the oil and gas industry to separate oil and gas in a production separator. It is a long tube that extends from the top of the separator down to the liquid level. The tube is designed to create a cyclonic flow pattern in the liquid, which causes the oil to separate from the gas and move to the top of the separator. The gas is then able to exit the separator through a separate outlet.

The Cyclone Dip Tube is a simple and effective way to improve the separation of oil and gas in a production separator. By using the cyclonic flow pattern, the tube is able to create a more efficient separation process, which can lead to increased production and

reduced costs.
