The oil cylinder luffing marine crane is a crane designed for ships and other ships. It is used for lifting and moving heavy cargo on and off ships, as well as for other maritime applications. The main feature of hydraulic cylinder luffing marine cranes is the use of hydraulic cylinders to control the angle of the crane boom. This allows the crane to move in a more controllable and precise manner than other types of marine cranes.

Hydraulic cylinders also allow cranes to lift heavy objects with a larger radius than other cranes, making them very suitable for use in port environments, where there may be limited mobility space. The oil cylinder luffing marine crane is usually installed on the deck of the ship and operated by trained personnel who use various control devices to move the crane and manipulate the boom. They are used for a wide range of applications, including loading and unloading cargo, lifting heavy equipment on and off ships, and performing maintenance and repair work on ships.
