The global Cylindrical Inductive Safety Switch market size is predicted to grow from US$ 461 million in 2025 to US$ 605 million in 2032; it is expected to grow at a CAGR of 4.0% from 2026 to 2032.

A cylindrical inductive safety switch is a type of non-contact sensor designed to detect the presence of metallic objects while meeting functional safety standards required for machine and operator protection. Housed in a round, threaded cylindrical body (typically in sizes like M8, M12, M18, or M30), this switch operates based on the principle of electromagnetic induction—generating an electromagnetic field that changes when a metal target enters its sensing range. Unlike standard inductive sensors, cylindrical inductive safety switches are certified for use in safety-critical applications, often achieving safety integrity levels such as SIL 2/3 (Safety Integrity Level) or PL d/e (Performance Level) as defined by international safety standards. Their rugged, wear-free design makes them ideal for harsh industrial environments, ensuring reliable position monitoring, presence detection, and machine interlocking in areas like automotive manufacturing, packaging lines, robotics, and material handling systems.

United States market for Cylindrical Inductive Safety Switch is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Cylindrical Inductive Safety Switch is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
