## Abstracts

The global Cyproheptadine Hydrochloride Tablets market size is predicted to grow from US\$ 183 million in 2025 to US\$ 252 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

Cyproheptadine hydrochloride tablets are an anti-allergy drug that mainly relieves allergic reactions such as urticaria, eczema, and pruritus by blocking the action of histamine. It also has antiserotonin (5-HT) and anticholinergic effects, which can stimulate appetite and promote weight gain. It is sometimes used to treat functional dyspepsia and migraines in children. It is a multifunctional prescription or over-the-counter drug.

Global production of cyproheptadine hydrochloride tablets is projected to reach 75 million units by 2025, with an average price of \$2.50 per unit. Gross profit margins typically range from 20% to 40%.

Cyproheptadine hydrochloride tablets are a classic antihistamine product. The upstream segment mainly consists of active pharmaceutical ingredient intermediates, basic chemical raw materials, excipients, and pharmaceutical packaging materials, with upstream supply stability and regulatory compliance directly affecting product cost and quality. The downstream segment is the key area of value realization and has relatively clear application scenarios. In the medical sector, general hospitals and primary healthcare institutions are the main users, where the drug is commonly prescribed for allergic rhinitis, urticaria, and other allergic conditions. Owing to its appetite-stimulating effect, it is also used in pediatrics, gastroenterology, and as supportive therapy in oncology and chronic wasting conditions. Retail pharmacies represent another important downstream channel, especially in developing regions and primary markets,

where stable demand is supported by low pricing and long-standing physician familiarity. In some markets, public procurement systems and inclusion in reimbursement lists play a decisive role in downstream volume. Overall, downstream demand focuses on therapeutic stability, safety, and affordability, with limited brand premium.

In terms of development trends, cyproheptadine hydrochloride tablets are in a mature or mildly declining stage, with limited expansion into new indications, yet maintaining long-term baseline demand in specific populations and underserved regions. Key drivers include the rising prevalence of allergic diseases, expanded access to primary healthcare, and continued preference for low-cost established medicines under healthcare cost-control policies. Constraints mainly stem from competition with newer-generation antihistamines that offer fewer sedative side effects and more convenient dosing, as well as stricter regulatory caution regarding sedative adverse effects in some countries, which reduces prescribing frequency. Due to low technical barriers and a high number of generic manufacturers, competition is largely price-driven.
