Cytokines and growth factors are both types of signaling molecules that play crucial roles in regulating cellular functions. Cytokines are small proteins involved in immune responses, inflammation, and cell communication, often modulating immune cell activity and directing cells to sites of infection or injury. They include interleukins, interferons, and tumor necrosis factors. Growth factors, on the other hand, are proteins that promote cell growth, differentiation, survival, and proliferation. They are essential for tissue repair, development, and regeneration, and include molecules like epidermal growth factor (EGF), fibroblast growth factor (FGF), and vascular endothelial growth factor (VEGF). While cytokines primarily influence immune and inflammatory responses, growth factors support tissue regeneration and cellular maintenance. Both are integral to maintaining cellular homeostasis and responding to environmental signals.
