The global Cytomegalovirus IgM Detection Kit market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Cytomegalovirus IgM Detection Kit is used for the detection of human antibodies in serum or plasma directed against Cytomegalovirus. Cytomegalovirus is a herpes virus. It is a leading etiological agent for congenital abnormalities and complications among those who receive massive blood transfusions and immunosuppressive therapy. About half of pregnant women who contract a primary infection spread the disease to their fetus. Infection during pregnancy may cause mental retardation, blindness, and/or deafness of the fetus. Cytomegalovirus infection is very common in the population, but most of them are subclinical recessive and latent infections. When the infected person is immunocompromised or pregnant, receiving immunosuppressant treatment, organ transplantation, or suffering from tumors, the virus can be activated and cause clinical symptoms. After human cytomegalovirus infects pregnant women, the virus infects the fetus through the placenta, causing intrauterine infection. Therefore, the detection of CMV-IgM antibody is of great significance for understanding the situation of human cytomegalovirus infection in women of childbearing age, early diagnosis of congenital human cytomegalovirus infection and prevention of birth of children with congenital infection.

United States market for Cytomegalovirus IgM Detection Kit is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
