Alanine (symbol Ala or A) is an α -amino acid that is used in the biosynthesis of proteins.

D-amino acids have gained attention in pharmaceutical research due to their potential as building blocks for developing novel drugs, peptides, and therapeutic agents. They can impart specific structural and functional properties that L-amino acids cannot, leading to unique pharmaceutical applications.

D-amino acids are utilized in peptide and protein engineering to enhance stability, selectivity, and functionality. Incorporating D-amino acids into peptides can improve their resistance to enzymatic degradation and enhance their bioactivity.
