The global D-pyroglutamic acid market size is predicted to grow from US$ 80.1 million in 2025 to US$ 125 million in 2031; it is expected to grow at a CAGR of 7.6% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Pyroglutamic acid (also known as PCA, 5-oxoproline, pidolic acid, or pyroglutamate for its basic form) is a ubiquitous but little studied natural amino acid derivative in which the free amino group of glutamic acid or glutamine cyclizes to form a lactam.

D-amino acids have gained attention in pharmaceutical research due to their potential as building blocks for developing novel drugs, peptides, and therapeutic agents. They can impart specific structural and functional properties that L-amino acids cannot, leading to unique pharmaceutical applications.

D-amino acids are utilized in peptide and protein engineering to enhance stability, selectivity, and functionality. Incorporating D-amino acids into peptides can improve their resistance to enzymatic degradation and enhance their bioactivity.
