## Abstracts

The global D-Tryptophan market size is predicted to grow from US$ 81.03 million in 2025 to US$ 127 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

In 2024, global D-tryptophan production was approximately 1200 tons, with an average selling price of about US$65/kg. Single-line production capacity was approximately 150 tons/year, with an average gross profit margin of 20-30%. D-tryptophan is a non-essential amino acid, an isomer of tryptophan, and is commonly used in drug synthesis and nutritional supplements. Unlike L-tryptophan, which is the common natural form in the human body, D-tryptophan has important applications in specific biological and pharmacological research. D-tryptophan plays an important role in the nervous system, particularly showing potential therapeutic effects in improving sleep quality and alleviating anxiety and depression. Furthermore, it is also used in food and health products as a health-promoting and anti-aging ingredient.

Upstream raw materials mainly include carbon and nitrogen sources such as glucose and corn steep liquor required through microbial fermentation and enzymatic catalysis processes, as well as synthetic substrates such as L-tryptophan or indole and serine as biosynthetic precursors. Downstream applications are primarily focused on the pharmaceutical and high-end health supplement industries. In the pharmaceutical field, it serves as a key chiral building block for synthesizing specific peptide drugs, antidepressants, and other active ingredients. In the health supplement field, it is used in dietary supplement formulations for functions such as sleep regulation and mood management.

United States market for D-Tryptophan is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
