Tyrosine (symbol Tyr or Y) or 4-hydroxyphenylalanine is one of the 20 standard amino acids that are used by cells to synthesize proteins.

D-amino acids have gained attention in pharmaceutical research due to their potential as building blocks for developing novel drugs, peptides, and therapeutic agents. They can impart specific structural and functional properties that L-amino acids cannot, leading to unique pharmaceutical applications.

D-amino acids are utilized in peptide and protein engineering to enhance stability, selectivity, and functionality. Incorporating D-amino acids into peptides can improve their resistance to enzymatic degradation and enhance their bioactivity.
