Dairy protein hydrolysates are products made by breaking down milk proteins (like whey and casein) into smaller peptides and amino acids through enzymatic or chemical processes called hydrolysis. This process, which cleaves peptide bonds, increases the number of hydrolyzed bonds compared to the original protein source, and results in a mixture of polypeptides, oligopeptides, and free amino acids. They are used in applications like infant formulas, sports nutrition, and other food products, often to enhance digestibility or reduce allergenicity.
