A tower crane is a piece of equipment used to move or transport oversized objects. It is a stationary device, which means the base of the crane does not move. A large, fixed tower supports a horizontal beam, or jib, which sits atop the tower to form an uneven letter "T." A tower crane is often used in the construction industry to set steel beams and other large building components. It may also be used in the shipping or transportation industry to load and unload large freighters. A dam is a barrier that stops or restricts the flow of water or underground streams. Reservoirs created by dams not only suppress floods but also provide water for activities such as irrigation, human consumption, industrial use, aquaculture, and navigability. Hydropower is often used in conjunction with dams to generate electricity. A dam can also be used to collect water or for storage of water which can be evenly distributed between locations. Dams generally serve the primary purpose of retaining water, while other structures such as floodgates or levees (also known as dikes) are used to manage or prevent water flow into specific land regions. This report focuses on the Dam Building Tower Cranes market.
