Dam and Fill glue is a special two-component electronic packaging material that is commonly used in the packaging process of electronic components, especially those that require the isolation of different materials or areas in a small space. Where gaps are also filled to provide mechanical support, heat dissipation or environmental protection.

Dam and Fill glue usually consists of two parts:

**Dam glue:** This is a glue with high viscosity and low fluidity. It is used to form a 'dam' structure, that is, to form a continuous barrier with a certain height between two areas that need to be isolated. The main function of Dam glue is to prevent subsequent filling glue from overflowing into areas that do not need to be filled, ensuring the accuracy and reliability of packaging.

**Fill glue:** This is a glue with low viscosity and good fluidity, used to fill the internal space of the dam formed by Dam glue. The main function of Fill glue is to provide mechanical support, heat dissipation, environmental protection or electrical insulation. The specific performance depends on the characteristics of the selected material.

The global Dam and Fill Encapsulant market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
