The global Dark Fiber market size is predicted to grow from US\$ 6755 million in 2025 to US\$ 15620 million in 2032; it is expected to grow at a CAGR of 13.0% from 2026 to 2032.

Dark Fiber refers to unused or unlit optical fiber cables that have been laid but are not currently active or connected to transmission equipment. These fibers are available for future use, leasing, or sale. Organizations may acquire dark fiber to gain full control over their data transmission infrastructure, allowing for private, scalable, and high-capacity network deployment.

The rapid development of data centers and cloud computing has driven the demand for high-bandwidth, low-latency private networks, and dark fiber leasing has become an important option.

The deployment of 5G and edge computing has driven the expansion of fiber infrastructure, and dark fiber resources have been activated and utilized at an accelerated pace.

Governments and large enterprises tend to build private networks to improve data security and network control, driving the growth of the dark fiber market.

Due to the high initial construction costs, some operators tend to sell or lease idle fiber assets to improve their return on investment.

In the regional backbone network and international submarine cable layout, dark fiber is regarded as a strategic resource, and its value continues to rise.
