A dark fiber optic network refers to a privately-owned or leased optical fiber network infrastructure that is installed but currently not in use (dark or unlit). The term 'dark' indicates that the fibers are not carrying any data signals, and they are available for future use. These dark fiber networks provide organizations with the flexibility to deploy their own network equipment and control the data transmission over the optical fibers.

The dark fiber optic network market represents a segment within the broader telecommunications and networking infrastructure industry. Key aspects of the market include:

### Scalability and Control:

Organizations opt for dark fiber networks to have full control over network infrastructure, allowing for scalability and customization according to their specific requirements.

### High Bandwidth Capacity:

Dark fiber networks offer high bandwidth capacity, making them suitable for data-intensive applications and the growing demand for increased network speed.

### Security and Performance:

As dedicated and privately controlled networks, dark fiber optics provide enhanced security and performance for sensitive data transmission.
