## Abstracts

The global Data Center Fluorocarbon Coolant market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Fluorocarbons are collectively called fluorinated liquids in the industry. They are a type of organic compound obtained by replacing part or all of the hydrogen contained in hydrocarbons with fluorine. This type of compound generally has good overall heat transfer properties and can Achieve no flash point and non-flammable properties. In addition, fluorinated liquid has good chemical inertness, good compatibility with electronic components made of various materials, and has good kinematic viscosity, which can flow and dissipate heat well in the temperature control system. Currently, fluorinated fluids are widely considered to be the most suitable for use in data center liquid cooling systems. Currently, common fluorocarbons include hydrofluoroethers (HFE), perfluorinated polyethers (PFPE), and perfluoroolefins.

Latest Development:

The latest document issued by China requires that by 2025, the PUE value of large and ultra-large data centers will be reduced to below 1.3, and liquid cooling can reduce the PUE value to around 1.1, meeting policy requirements.

In December 2022, 3M announced that it would withdraw from all perfluorinated and polyfluoroalkyl substances (PFAS) production by the end of 2025. 3M will stop producing all fluoropolymers, fluorinated fluids and PFAS-based additive products.
