Abstracts

The global Data Center Indirect Evaporative Cooling Unit market size is predicted to grow from US$ 812 million in 2025 to US$ 1766 million in 2032; it is expected to grow at a CAGR of 12.2% from 2026 to 2032.

Data Center Indirect Evaporative Cooling Unit is an air handling and cooling system designed to support environmental control and heat removal in data center facilities. It uses an isolated heat exchanger to transfer heat between data center return air and outdoor air that has been cooled through evaporation, allowing the indoor recirculated air to be cooled without direct contact with the outside air. The unit typically consists of an air-to-air heat exchanger, an evaporative cooling module, fans, a water circulation system, filtration components, a control system, and an auxiliary mechanical cooling system. Based on outdoor temperature, humidity, and data center cooling load, the unit can switch among dry heat exchange, indirect evaporative cooling, and mechanical cooling modes. It is primarily used for efficient thermal management in server rooms, modular data centers, and large-scale data center facilities. The unit price of Data Center Indirect Evaporative Cooling Unit typically ranges from tens of thousands to hundreds of thousands of US dollars, with a gross profit margin usually between 25% and 35%.

The upstream supply chain of Data Center Indirect Evaporative Cooling Units mainly includes suppliers of heat exchanger cores, metal sheets, evaporative cooling media, fans, motors, pumps, valves, filters, sensors, controllers, variable frequency drives, compressors, refrigerants, structural components, and other materials and parts. Midstream companies are responsible for unit design, heat exchange system development, evaporative cooling module integration, airflow optimization, control strategy development, equipment manufacturing, performance testing, and project-

specific adaptation. They also provide customized products and system solutions based on climatic conditions, data hall layouts, and cooling load requirements. Downstream customers mainly include cloud service providers, internet companies, telecommunications operators, financial institutions, government and public sector organizations, data center operators, colocation service providers, and large enterprises operating their own data centers. These products are generally delivered to end-user projects through data center design institutes, engineering contractors, mechanical and electrical installation companies, and thermal management system integrators.

The Data Center Indirect Evaporative Cooling Unit market is driven by the expansion of data center computing infrastructure, increasing rack power density, stricter energy efficiency and carbon reduction requirements, and growing pressure to reduce the energy consumption of conventional mechanical cooling systems. These units utilize indirect heat exchange between air and water to take advantage of natural cooling resources while preventing outdoor air from entering the data hall directly, thereby reducing the operating load of compressor-based cooling systems. They offer strong application potential in large-scale data centers, hyperscale data centers, and regions with favorable climatic conditions. Market competition is primarily focused on heat exchange efficiency, annual energy performance, environmental adaptability, control systems, modular design, reliability, and integration with overall data center thermal management systems. As high-density computing, artificial intelligence server deployment, and green data center development accelerate, products featuring low energy consumption, reduced water use, intelligent control, and flexible switching among multiple cooling modes are expected to gain broader market acceptance.
