Data center operation and maintenance robots are intelligent autonomous robots that use technologies like AI, IoT, and advanced sensors to perform tasks such as equipment inspection, asset auditing, and environmental monitoring. They collect data like temperature and humidity, providing real-time insights for predictive maintenance and faster fault detection. These robots enhance efficiency, security, and reliability by automating routine tasks, enabling remote operations, and improving overall operational management in data centers.

The upstream segment is the technological core and value center of the industry chain, directly determining the performance, reliability, and cost of robots. Reducers, servo motors, and controllers are the three core components of traditional robots, responsible for precise motion and accurate control. The midstream segment is responsible for integrating upstream components and software into usable robotic products and providing comprehensive solutions for downstream customers. The downstream segment is the final implementation link in the industry chain, determining the market potential and value realization of the products. Downstream customers are primarily
