The global Data Center Power Distribution Units market size is predicted to grow from US\$ 1101 million in 2025 to US\$ 1413 million in 2032; it is expected to grow at a CAGR of 3.5% from 2026 to 2032.

In 2025, global Data Center Power Distribution Units production reached approximately 2,500 k units?with an average global market price of around US\$ 450 per unit, and a gross profit margin of approximately 20%-40%. Data Center Power Distribution Units are power distribution devices used in data halls and racks to deliver electricity from facility feeds to IT equipment safely and reliably. They provide multiple outlets, branch protection, and standardized connectors for servers, storage, and networking.

Advanced units add metering for voltage, current, power, and energy, plus alarms and remote management to support capacity planning and uptime. PDUs are deployed as basic, metered, monitored, or switched models, and are engineered for high current, redundancy, and continuous operation in high-density environments. The industrial chain of Data Center Power Distribution Units includes upstream sheet metal and plastics, copper busbars, outlets and plugs, breakers and fuses, relays or contactors, current transformers, metering ICs, sensors, microcontrollers, communication modules, and power supplies. Midstream covers electrical and mechanical design, wiring harnessing, insulation and grounding, firmware development, calibration, safety and EMC compliance testing, and factory QA. Downstream users include hyperscale and enterprise data centers, colocation facilities, and edge sites, supported by deployment, configuration, monitoring integration, maintenance, and spares services.

The Data Center PDU market is expanding as rack power density rises and operators require more granular visibility and control over power delivery. Growth is supported by new data center builds, AI cluster deployments, and edge expansion, all of which

increase the number of racks and the need for safer distribution and monitoring. Demand is shifting from basic PDUs toward metered and monitored models that enable outlet-level or branch-level measurement, faster troubleshooting, and better capacity planning. Cybersecurity, firmware lifecycle support, and integration with DCIM/BMS platforms are becoming key buying criteria. Buyers also emphasize reliability, redundancy options, and compliance, because PDU failure can directly impact uptime. Price pressure exists in commodity models, so suppliers compete through telemetry features, ease of deployment, and service responsiveness. Overall, steady growth is expected as power management becomes more data-driven.
