Database Audit and Protection Systems are data security products designed for enterprise database environments. They are primarily used for real-time monitoring, recording, analysis, and protection against database access behavior, operation logs, permission usage, and abnormal activities. These systems are typically deployed in relational database, data warehouse, and cloud database environments, supporting mainstream database platforms such as Oracle, MySQL, SQL Server, and PostgreSQL. Their core functions include database operation auditing, sensitive data access tracking, SQL behavior analysis, anomaly alerts, database firewalls, compliance auditing, and risk tracing. They help enterprises detect internal violations, external attacks, data breaches, and high-risk SQL behaviors. DAS are widely used in highly data-sensitive industries such as finance, telecommunications, government, energy, healthcare, and the internet, and are also a crucial infrastructure component for meeting data security and compliance requirements such as GDPR, Cybersecurity Classified Protection 2.0, SOX, and PCI-DSS.

Automobile electronics trend: With the continuous development of automobile electronic technology, there are more and more indicator lights in automobile dashboards, and their functions are becoming more and more abundant. These indicators can display the status and fault information of the vehicle in real time, helping the driver to understand the vehicle status in a timely manner and improve driving safety. Safety needs: Automobile safety is one of the focuses of consumers' attention. As one of the important guarantees for vehicle safety, automobile dashboard indicators have a growing market

demand. For example, the emergence of safety-related indicators such as ESP, ABS, and braking systems has improved the safety performance of vehicles and also promoted the development of automobile dashboard indicators. Intelligent trend: With the development of intelligent technology, automobile dashboard indicators are also developing in an intelligent direction. For example, through an intelligent fault diagnosis system, vehicle faults can be automatically detected and alerted to the driver, improving driving safety.
