Daunorubicin is mainly used for acute lymphocytic or myelogenous leukemia resistant to common anti-tumor drugs, but the remission period is short, so it needs to be combined with other drugs. It is orange-red acicular crystal, easily soluble in water. Its aqueous solution is quite stable and can be kept at 0° or 37° for 3 weeks without changing its activity. The effect is the same as adriamycin, embedded DNA, can inhibit the synthesis of RNA and DNA, the effect on RNA is particularly obvious, selective effect on purine nucleoside.
