The global Dauricine market size is predicted to grow from US\$ 211 million in 2025 to US\$ 331 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

Brahmacodactyline is a dibenzylisoquinoline alkaloid extracted from the traditional Chinese medicinal plant *Stephania tetrandra*. It possesses various pharmacological activities, including anti-inflammatory, anti-fibrotic, anticancer, immunomodulatory, and antihypertensive effects. Due to its ability to effectively inhibit intracellular calcium ion influx, reduce inflammatory responses, and inhibit tumor cell proliferation, brahmacodactyline is widely used in research on the treatment of rheumatic diseases, pulmonary fibrosis, hypertension, and various cancers, making it an important active ingredient in modern drug development and traditional Chinese medicine research.

The purslane industry chain mainly consists of raw material cultivation, extraction and processing, active pharmaceutical ingredient (API) production, formulation application, and end-user medical/scientific research. Upstream, it relies on the cultivation and harvesting of plants such as purslane; the quality and yield of raw materials are affected by region, climate, and management methods. Midstream, through processes such as solvent extraction and column chromatography purification, obtains high-purity purslane APIs. This stage has high technical barriers and accounts for the largest cost, representing the core value of the industry chain. Downstream includes pharmaceutical companies, traditional Chinese medicine manufacturers, and research institutions, using purslane in functional formulations such as analgesics, anti-inflammatories, and antiplatelet drugs, as well as in pharmacological mechanisms and new drug development. The final products enter hospitals, pharmacies, and research markets. The entire industry chain is characterized by strong dependence on raw materials, high requirements for extraction processes, and dispersed downstream applications.

In 2024, global purslane production reached 4,900 grams, with an average selling price

of US\$42 per milligram. The gross profit margin was approximately 39%, and the capacity utilization rate was approximately 72%.

Piperine is an alkaloid extracted from the traditional Chinese medicine kudzu (*Pueraria lobata*). It possesses certain analgesic, anti-inflammatory, anti-platelet aggregation, and immunomodulatory effects, attracting attention in both traditional Chinese medicine and modern drug development. Its advantages lie in its natural source, clearly defined pharmacological activity, and potential development as a proprietary Chinese medicine or as an active ingredient for research. Disadvantages include the influence of planting and harvesting conditions on the raw materials, complex and costly extraction processes, and the fact that downstream markets primarily rely on clinical needs and regulatory policies governing traditional Chinese medicine, limiting large-scale commercialization. Therefore, the industrial development of piperine requires a balance between sustainable raw material supply, process optimization, and expanded clinical applications.
